

Part of the requirements not completed/implemented in the project

i) Bucket for users:

This functional requirement was planned to provide a bucket for users to store their 5-6 stocks in which they are more interested. As we have to fulfill functional requirements with higher priority and also time being a constraint, this idea was later dropped.

ii) Login/Logout:

Initially, we have planned to provide login/logout functionality. But it was not implemented as it doesn't provide any further functionality other than we can store buckets for every user which was not going to be implemented.

iii) Candlestick and histogram graphs :

During early development for the various graphs used to analyze the stock data, candlestick and histogram were considered .Candlestick is more useful when you are trading intraday but our website is not for intraday trading and candlestick is more suitable for drawing some patterns.
